PROJECT REPORT

Title: **BMI Health Analyzer**

Prepared By : **J Jessica**

Course: **Python Essentials**

Submission Date:**31.03.2026**

INTRODUCTION

In today,s fast lifestyle many people doesn't pay attention to their health.They often ignore their body weight and do not realize whether they are underweight, normal, or overweight.Body Mass Index (BMI) is a simple method that helps in understanding a person's health condition based on weight and height.
This project that I made is a small attempt to create awareness about health using a simple python program.

PROBLEM STATEMENT

Many people are not aware of their body weight condition and related health risks. Due to lack of awareness, they ignore early signs which may lead to health problems in the future.

OBJECTIVE

The main objectives of this project are:

- *Calculating BMI using weight and height of the user.*

- *Classifying the user into different health categories.*
- *Providing basic health advice based on BMI*
- *Creating awareness about health in a simple way*

METHODOLOGY

In my project,a python program is developed to calculate BMI.
First,the user is asked to enter their weight (in kilograms) and height (in metres).Then BMI is calculated using a mathematical formula. Based on the calculated value, conditions are applied using if-else statements to determine the health category such as underweight, normal, overweight, or obese.

Finally,the program displays the BMI value along with health advice.

FORMULA USED

BMI is calculated using the formula:

```
BMI=weight/ (height*height)
```

FEATURES OF THE PROJECT

- *It is simple and easy to use*
- *It calculates BMI accurately*
- *It displays health category*
- *It provides basic health suggestions*
- *It helps in spreading health awareness*

CODE EXPLANATION

The code is written in Python and uses basic concepts such as functions,user input,and conditional statements.
Functions are used to calculate BMI and determine the category. If-else conditions are used to classify the BMI into different categories.The program also prints advice based on the result.

CHALLENGES FACED

While working on this project, I faced some small challenges such as handling user input correctly and performing calculations properly. However, I was able to solve them by testing the code multiple times.

FUTURE SCOPE

- *It can be used for adding a graphical user interface(GU)*
- *It can be used for including more health parameters like age and diet.*
- *It can be used for storing user data for tracking*

REFERENCES

- *Used basic BMI concepts*
- *Used python programming concepts that I have learned in the course.*
